Introduction to Machine Learning

Session 2b: Advantages and Disadvantages of Trees

Reto Wüest

Department of Political Science and International Relations University of Geneva

Outline

1 Trees Versus Linear Models

2 Advantages and Disadvantages of Trees

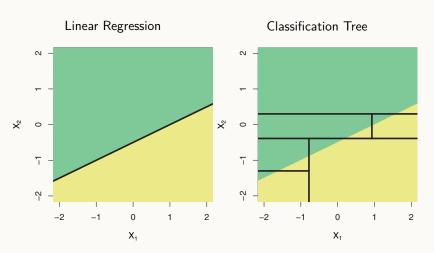

Trees Versus Linear Models

Trees Versus Linear Models

- When does a regression tree perform better than linear regression?
- If the relationship between the predictors and the response is well approximated by a linear model, then linear regression will outperform a method such as regression tree that does not exploit this linear structure.
- If the relationship between the predictors and the response is highly non-linear and complex, then a regression tree may outperform linear regression.
- Note that the relative performances of regression tree and linear regression can be assessed by estimating the test error, e.g., using CV.

Trees Versus Linear Models: Example

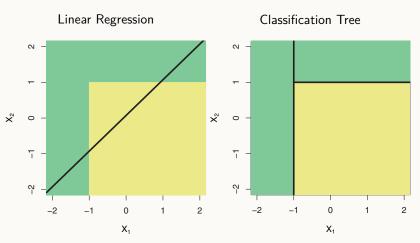

Two-Dimensional Classification Problem With a Linear Decision Boundary

(Source: James et al. 2013, 315)

Trees Versus Linear Models: Example

Two-Dimensional Classification Problem With a Non-Linear Decision Boundary

(Source: James et al. 2013, 315)

Advantages and Disadvantages of Trees

Advantages of Trees

- Trees are very easy to explain to people. In fact, they are even easier to explain than linear regression.
- Some people believe that decision trees more closely mirror human decision-making than do the classical regression and classification approaches.
- Trees can be displayed graphically, and are easily interpreted even by a non-expert (especially if they are small).
- Trees can easily handle qualitative predictors without the need to create dummy variables.

Disadvantages of Trees

- In general, trees do not have the same level of predictive accuracy as other supervised learning methods (e.g., shrinkage methods).
- Trees can be very non-robust: a small change in the data can cause a large change in the final estimated tree.
- ⇒ By aggregating many decision trees (bagging, random forests, boosting), the predictive performance of trees can be substantially improved.
- \Rightarrow Bagging, random forests, and boosting use trees as building blocks to construct more powerful prediction models.
